

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

VI. *Some farther Observations relating to the Natural History of Wales. In a Letter from Mr. Edw: Lhwyd to Dr. Tancred Robinson, F. R. S.*

Usk in Monmouthshire, June 15. 1697.

S I R,

THE most considerable Discoveries, since my last, were some new *Species* of *Glossopetra* and *Siliquastra*, (the first *Ichthyodontes*, I suppose, that ever were observ'd in *Wales*) on the top of a high Mountain called *Blorens* near *Aber Gavenni*. The *Siliquastra* were smaller than the generality of those I had observ'd in other Countries. Of the *Glossopetra* we found one pretty large; but the rest very small; all black, or atrorubent. The same place afforded also some variety of Fossil Shells, and plenty of *Cuthbert's* Beads, which were very small in comparison of what are found throughout the North of *England*. We also found there a large Testaceous Body, not to be compar'd as to its Figure with any sort of Shell yet describ'd: Together with some embossed Representations of pieces of the Skeletons of Eels, or some lesser Fish. All these were in Limestone; but

Advancing about 3 Miles further into *Brecknockshire*, at a place call'd *Lhan Elhi* we searched some Coal and Iron Mines. Their Coal-works were not Pits sunk like Draw-wells; but great Inroads made into the side of the Hill, so that three or four Horsemen might ride in abreast. The Top is supported with Pillars left at certain distances; and they make their By-lanes (as in other Pits) as the Vein requires. The Slat above this Coal afforded only Stalks of Plants, which we did not

save, because it seem'd impoitible to reduce them to their feveral proper *Species*. However, clofe by the Pit we found a valuable Curiofity, viz. a Stone for fubftance like thofe they make Lime of; of a comprifs'd Cylinder Form; and as it were cut off even at each End: About 8 Inches long, and 3 in breadth: Its *Superficies* adorn'd with equidiftant Dimples, like Dr. Plot's *Lepidotes*, *Hift. Ox. chap. 5. par. 55.* and in each Dimple a fmall Circle; and in the Center of each Circle a little Stud like a Pins head. This is the only Curiofity of the kind I have feen; and is not referable to any thing I can think of, either in the Animal or Vegetable Kingdom. Among the Iron Oars of the fame Hills we found fome new Spars, and feveral Specimens of Oars fhut into a conftant and regular Figure, tho not reducible to any Animal or Vegetable Bodies.

About 5 Miles thence, at a place called *Pont y Pwl* in this County (where, as alfo at *Lhan Elhi*, there are Furnaces and Forges,) we found more Coal and Iron-Mines; and collected fome fair Representations of the Leaves of Capillary Plants on the Iron Oar, but found no Branches. One Major *Hanbury* of this *Pont y Pool*, fhew'd us an excellent Invention of his own, for driving hot Iron (by the help of a Rolling Engin mov'd by Water) into as thin Plates as Tin: But without a Draught of the Machine I cannot give you a Notion of it. They cut their common Iron Bars into Pieces of about two foot long; and heating them glowing hot, place them betwixt thefe Iron Rollers; not acrofs, but their Ends lying the fame way as the Ends of the Rollers. The Rollers (moved with Water) drive out thefe Bars to fuch thin Plates, that their Breadth, which was about 4 Inches, becomes their Length, being extended to about 4 Foot; and what was before the Length of the Bars is now the Breadth of the Plates. With thefe Plates he makes Furnaces, Pots, Kettles, Sauce-Pans, &c.

Thefe

These he can afford at a very cheap rate (about the third part of what is usual) and yet dares warrant them not less serviceable: So that it is not to be doubted, but that he will meet with the Encouragement due to so Ingenious and useful an Invention. He sends most of his Plates to *London* (where he has Workmen) making at home only what he finds the Country will take off. I am,

Sir,

Your most obliged Servant,

E. LHWYD.

P. S. We had at *Pont y Pool*, on the 6th instant, an extraordinary Shower of Hail; which extended about a Mile, and lasted near half an Hour. It broke down the Stalks of all the Beans and Wheat within that Circumference; and ruined as much Glass at Major *Hanbury's* House, as cost 4*l.* the repairing. Some of the Hail were 8 Inches about; as to their Figure, very irregular and unconstant; several of the Hail-stones being compounded, as the Major judg'd, who saw them.
